

When image is everything!

The Supra is, by far, the most popular and attractive door on the market. Made of high-quality aluminium and tempered glass, it combines visibility with full protection.

Preventing "reach through and grab" theft, the tempered glass panels are very resistant and, unlike plastic, they resist scratching, and they do not attract dust or emanate toxic fumes during a fire.

Furthermore, the Supra, by its conception, will protect your merchandise from dirt and dust while retaining heated and/or cooled air.

Its proven durability and easy operation make it the ideal closure for any mall application. The most tasteful protection available.

Easy on the eyes, tough on theft!

Opak

A solid version of our Supra, the Opak is a very versatile closure, offering maximum strength and durability for high-security applications.

When a visual as well as a protective barrier is required, the Opak's full-height aluminium panels make it the best protection available.

Its sturdiness and opacity, added to the quality of its conception, render the Opak a highly visible theft deterrent.

Visionair

The Visionair is conceived for applications where security, air circulation and a certain level of visibility are required.

It distinguishes itself by its design. Its full-height, perforated panels combine the strength of metal with good-looking protection.

It is ideal for applications where you want to prevent "reach through" burglaries and vandalism.

The Visionair, if you must be different.

Invisible during the day, it will assure your peace of mind after business hours!

The S-126 is the answer to all your security needs. Resistant and discreet, light and sober, this aluminium closure brings you protection, visibility and accessibility.

Made of 5/16" vertical rods alternately covered by 1/2" tubes and joined together by horizontal steel links, unlike aluminium links of other makes, our S-126 closure offers added strength.

The use of our top and bottom positive action hinge panels ensures that the operation of the S-126 will be easy and durable.

We also offer a variation of the S-126, the S-126W for all window applications. Its retractable feature provides that extra accessibility to your windows. It can be opened, and out of sight during business hours.

The S-126 is the most economical closure offering extra security needed to discourage break-ins. Its discreet pattern blends in well with any decor for an unobtrusive window security system. It is window protection with appeal.

Protect your goods, discourage theft and vandalism, and lower your insurance premium by installing our S-126 security grille.

When good looks do matter!

Selectra

The Selectra is perfect for applications where airflow, strength and maximum visibility are important.

Adequate as an individual closure or added to an existing window, the Selectra is ideal for room dividing, unlimited security applications and/or crowd control.

Strong vertical hinges and 1/2" cover sleeves give this model the extra resistance needed. A highly resistant and unobtrusive open grille pattern designed to provide years of trouble-free service.

Protek

The Protek, a variation of our Selectra, is the most popular closure where conditions require a high level of security to protect small items and maintain air circulation. This design combines light weight, good visibility and easy operation.

The Protek offers very narrow spacing (1 1/4") between the vertical rods. By using our patented one-piece hinge concept, we are able to offer the tightest pattern curtain available without increasing folding requirements.

The Protek, when you want them to look with their eyes, not their hands.

For an “old school” closure!

The Classik is a closure that blends solidity and aesthetics. Its checkerboard design has been a standard in the industry for many years. Identical in strength and operation to the Selectra model, it is a semi-opaque curtain with a decorative presence, and it is used where visibility is not an important factor.

The Classik provides durability, air circulation and easy operation. It has a pattern that offers extra visual impact, popular for crowd control applications.

The C-525 is one of many design variants possible within the Classik concept. It offers strength with a measure of added visibility.

Manufactured to be space-efficient!

R-1000: With very narrow 1" spacing between horizontal bars, where conditions require high security to prevent "grab through" burglary, vandalism and protection of small items.

R-2000: Offering 2 1/4" spacing between horizontal bars, a durable and easy to operate rolling grille that will discourage break-ins while providing an unobstructed view of your merchandise.

R-OLEX: Polycarbonate panel inserts offer outstanding see-through vision while the best quality aluminium assures strength, security and durability.

R-VISION: Made of perforated panel inserts and the best quality aluminium. For applications where a certain level of visibility and air circulation is required.

Shutter: Consisting of solid aluminium slats. For security applications where a visual barrier is required.
